## About EVAPCO

Evapco is the global innovator in heat transfer solutions. Our pledge is to make everyday life easier, more comfortable, more reliable, and more sustainable for people everywhere. With manufacturing facilities and sales offices in more than 50 countries and 48 active US patents—we are the team that engineers and contractors know they can count on for life.

## Evolution of Heat Transfer Technology

EVAPCO has a long standing commitment to heat transfer research and development. This commitment has resulted in a number of advancements in heat transfer coil design. Up until the mid-1980's, evaporative condensers were manufactured with tightly packed round tube coils. Through thousands of hours of testing and research, EVAPCO developed the Thermal Pak® coil. The Thermal Pak® coil was patented in 1987, (now expired), and changed the thinking of system design engineers by changing the shape of the coil tubes. The elliptical tube design maximized the effective tube surface area while lowering airside pressure drop and allowing for higher water loading. The combination of the elliptical shape tube in the Thermal Pak® orientation increased heat transfer efficiency and resulted in one of the highest capacities per plan area of evaporative condensers available today.

Throughout the late 1980's and into the 1990's EVAPCO was continuously looking for ways to improve heat transfer efficiency. This research resulted in the development of the Thermal Pak® II heat transfer coil. The Thermal Pak® II coil utilized the same elliptical shape tube introduced in the original Thermal Pak coil, but changed the orientation of the tubes to improve the tubes air to water interface for increased heat transfer efficiency.

Thermal-Pak® II Coil by EVAPCO

Research and development is an on-going process at EVAPCO. Through the success of the Thermal Pak II coil, EVAPCO saw the potential for new coil configurations and the need for new manufacturing technology to improve processes and efficiency. During this same time, it became evident that a need exists for more environmentally conscious cooling products.

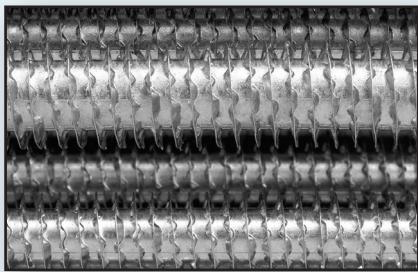

The combination of EVAPCO's R&D, manufacturing and environmental commitment has resulted in the development of **Ellipti-fin®** Coil Heat Transfer Technology.

The **Ellipti-fin®** coil utilizes elliptical shape tube with extended surface fins for maximum heat transfer efficiency. The extended surface increases the heat transfer efficiency in the evaporative or wet mode as well as the dry mode of operation.

# eco-ATC-H Design & Construction Features

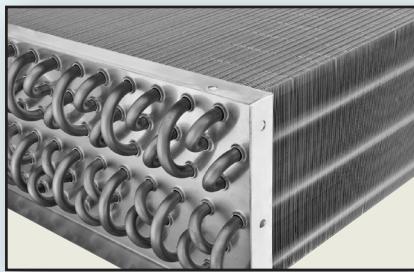

## eco-ATC-H Dry Performance Powered by Innovative Coil Technology

### **Ellipti-fin®** Heat Transfer Coil

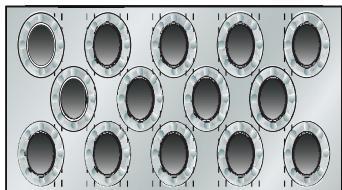

- Elliptical Tubes with Spiral Wound Fins
- Improved Dry and Wet Operation
- All Rows Finned
- Hot-Dip Galvanized Steel
- Nitrogen Charged Before Shipment

### **ARID fin Pak™** Dry Cooling Coil

- Superior Dry Heat Transfer
- 5/8" Type 304L Stainless Steel Tubes
- Marine Grade Aluminum Fins
- Hydraulically Expanded
- Nitrogen Charged Before Shipment

**Ellipti-fin®** Finned Elliptical Tube by EVAPCO

The **Ellipti-fin®** coil incorporates features of both the Thermal Pak and Thermal Pak II coils as the tubes are oriented vertically yet spaced so as not to increase the airside pressure drop. As such, eco-ATC-H condensers are not subject to the performance penalties normally associated with round tube extended surface coils.

**Ellipti-fin®** coils are manufactured from high quality carbon steel tubing following the most stringent quality control procedures and in accordance with the ASME B31.5 Refrigerant Piping Code. Each circuit is inspected to assure the material quality and tested before fins are wound onto the surface of the tube. Each circuit is then assembled into a complete coil with a design pressure of 300 psig (optional design pressure of 400 psig is available). Finally the assembled coil is strength tested in accordance with ASME B31.5 and subsequently leak tested using air under water. To protect the coil against corrosion, and complete the bond between tube and fin, the entire assembly is dipped in molten zinc (hot dip galvanized) at a temperature of approximately 800°F.

The **Ellipti-fin®** coil design utilizes counterflow heat transfer. The rows of the finned elliptical tubes are positioned vertically in the direction of airflow to enhance turbulence, which increases heat transfer while minimizing airside pressure drop. The design features of EVAPCO's **Ellipti-fin®** condensing coils ensure the end-user will receive maximized evaporative heat transfer efficiency wet or dry.

### **ARID fin Pak™ Dry Cooling Coil**

**ARID fin Pak™** Dry Cooling Coils are constructed with 5/8" diameter type 304L stainless steel tubing and marine-grade aluminum fins. The stainless steel tubing meets the requirements of ASME B31.5 refrigerant piping code. The standard **ARID fin Pak™** Dry Cooling Coils are designed with a fin density of 10 fins per inch for maximum heat transfer efficiency in the smallest plan area. Optional fin densities are available (Consult the factory for selections and pricing).

The SST 304L round tubes are fit into the aluminum fin plate and hydraulically expanded. EVAPCO's precisely controlled hydraulic expansion process results in more consistent contact between the tube and fin plate than conventional mechanical expansion methods. The **ARID fin Pak™** dry cooling coil has a design pressure of 300 psig (optional design pressure of 400 psig is available) and is strength tested in accordance with ASME B31.5 and nitrogen charged prior to shipment.

# eco-ATC-H Design & Construction Features

The eco-ATC-H line of evaporative condensers represents EVAPCO's newest advancement in thermal heat transfer research and development. Utilizing the **ARID finPak™** heat transfer coil, the eco-ATC-H offers improved heat transfer during dry operation and significant water savings due to extended periods of dry operation. The eco-ATC-H is the latest example in EVAPCO's on-going commitment to quality, environmentally friendly products.

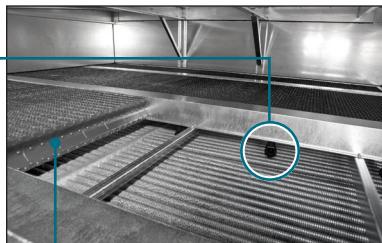

## PVC Spray Distribution Header with ZM®II Nozzles

- Large orifice nozzles prevent clogging (no moving parts).
- Redesigned nozzles for superior water distribution.
- Nozzles are threaded into header at proper orientation.
- Fixed position nozzles require zero maintenance.
- Threaded end caps for ease of cleaning.
- Guaranteed for life.

## Self Supporting Service Platforms (Optional)

- Dual platform arrangement provides access to wet/dry coils and drive system.
- Includes access ladders - field installed.

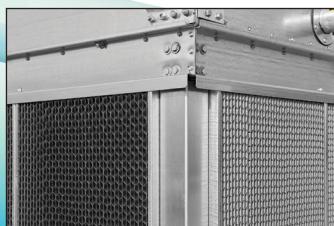

## Air Inlet Access Door (Optional)

- Increased ease of access to basin.
- Hinged access panel with quick release mechanism.
- Not available on all models.

## WST Framed Inlet Louvers (Water and Sight Tight)

- Framed for easy handling, tighter fit and longer life
- Design keeps sunlight out – preventing biological growth.
- Keeps water in while keeping dirt and debris out.

## "Clean Pan" Basin Design

- Access from all four sides.
- Large open area simplifies maintenance.
- Basin may be inspected with pumps running.
- Sloped basin design prevents sediment buildup, biological film and standing water.

### Super Low Sound Fan (Optional)

- 9-15 dB(A) sound reduction.
- Extremely wide chord fan blades for sound sensitive applications.
- One piece molded heavy duty construction.

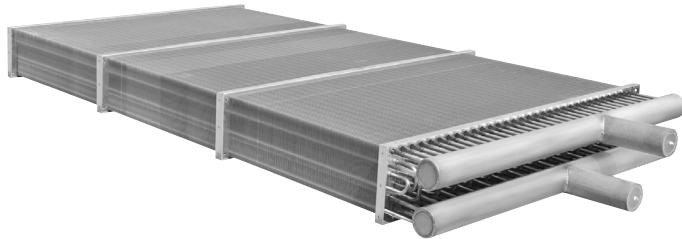

### Advanced Drive System Design

- Totally Enclosed Fan Motors assures Long Life.
- Power-Band Belts for Better Lateral Rigidity.
- Advanced Design Aluminum Fan Blades.
- Non-corroding Cast Aluminum Sheaves.
- Heavy-Duty Fan Shaft Bearings with L-10 Life of 75,000 - 135,000 hrs.
- All Other Components Corrosion Resistant Materials.
- All Components Covered by 5 Year Warranty.

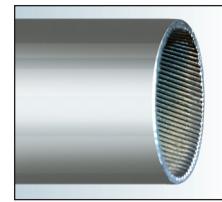

### ARID fin Pak™ Heat Transfer Technology

- Type 304L stainless steel tube/aluminum fin coil located above drift eliminators.
- Designed to operate in dry mode for an extended period.
- High heat transfer efficiency.

### Ellipti-fin® Heat Transfer Technology

- Features EVAPCO's exclusive CROSScool™ tube enhancement for greater internal heat transfer.
  - Thermal Pak® coil with extended surface.
  - Water savings through extended periods of dry operation.
  - High heat transfer efficiency.
  - Low refrigerant charge.
- Patent Pending

CROSScool™

### Unique Field Seam

- Eliminates up to 66% of fasteners.
- Self guiding channels improve quality of field seam to reduce leaks.
- Easy to install.
- Lower installation cost.

### Solid Chemistry Water Treatment

(Optional)

- Controlled release chemistry provides uniform treatment over a 30 day period.
  - Factory mounted and wired.
  - Easier and safer, eliminates the potential for liquid spills.
- U.S. Patent No. 8,398,850

### Totally Enclosed Pump Motors

- Help assure long, trouble-free operation.

### Non-Chemical Water Treatment (Optional)

- Scale, corrosion and bacteria control.
- Factory mounted with single source responsibility.
- Environmentally safe, chemical-free water treatment.

U.S. Patent No. 7,704,364

# eco-ATC-H Water Saving Technology

## Engineered for Efficient Dry Performance to Meet Future Global Climate Change and Water Use Restrictions

### Significant Water Savings

The **ARID fin Pak™** Dry Coil combined with EVAPCO's **Ellipti-fin®** coil technology enables the eco-ATC-H to be operated in a 100% Dry Mode at a significantly higher switchover temperature than that of a typical bare tube coil evaporative condenser. This leads to a much higher number of hours per year the condenser can operate in dry mode (spray pumps off), thus significantly reducing annual water consumption. This combination of heat transfer technologies makes the eco-ATC-H the most water efficient EVAPCO condenser.

Consider a meat processing plant application near Wichita, KS where a condenser is required to reject a constant heat load of approximately 7,500 MBH at a 95°F condensing temperature and a summer design wet bulb temperature of 78°F. The process operates 24 hours a day, five days a week.

The ATC-E evaporative condenser, the eco-ATC-A and the eco-ATC-H evaporative condenser are compared as follows:

### Model Comparison

Model	ATC-791E	eco-ATC-761A	eco-ATC-H 12-2K24-U34
Plan Area	12' x 20'	12' x 20'	12' x 24'
Total Fan Motor	40 HP	40 HP	40 HP
Total Pump Motor	10 HP	10 HP	10 HP

### Dry Operation Performance Comparison

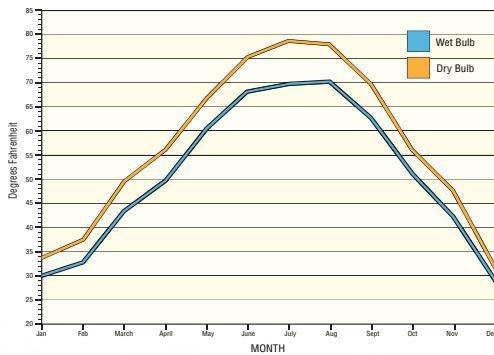

Model No.	Design Capacity (MBH)	Dry Bulb Switch Point (°F) (% Design Capacity)		
		100%	75%	50%
ATC-791E	7910	-39.9	-6.2	27.5
eco-ATC-761A	7610	12.1	32.4	53
eco-ATC-H 12-2K24-U34	7520	38.7	52.5	66.5

# eco-ATC-H Water Saving Technology

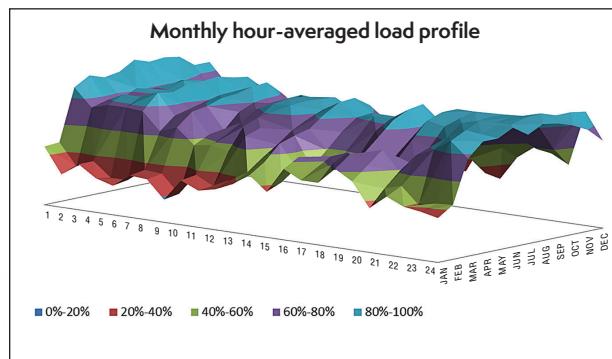

## eco-ATC-H Water Saving Analysis

Utilizing the Water & Energy Savings Calculator in Spectrum™ with required key inputs:

Monthly Average Ambient Temperature  
Wichita, KS

Load Profile: Meat Processing

**Weather Station:** For Wichita, KS, the selected weather station is McConnell AFB

The Temperature Profile generated to estimate water and energy usage is based on 5 year weather data from the National Climatic Data Center (NCDC). The weather data shown above was collected from MC CONNELL AFB, USA

For more information visit: <http://www.ncdc.noaa.gov/oa/ncdc.html>

### Meat Processing

Profile Provided Courtesy of Cascade Energy

#### Cycles of Concentration: .....

Historical water analysis for Wichita, KS is on average 4 cycles

#### Profile Days: .....

5 Week Days, and 2 Weekend Days

#### Potable Water Cost for Wichita: .....

Estimated at .0028 \$/gal

#### Waste Water Treatment Costs for Wichita: .....

Estimated at .0031 \$/gal

#### Power Costs: .....

Estimated at .0637 \$/kwh

### Water and Energy Analysis\*

Selected Weather Station: McConnell AFB

Condensing Temperature: 95°F

Wet Bulb Temperature: 78°F

Refrigerant: NH3

Load Profile: Beef

Weekend Days: 2

Cycle of Concentration: 4

Model Number:	ATC-791E	eco-ATC-761A	eco-ATC-H 12-2K24-U34
Quantity: Dry Bulb Switchover(°F)	1.00 -39.9	1.00 12.1	1.00 38.7
Total Estimated Water Usage per year (gal.)	4,616,650	4,008,150	3,360,490
Total Estimated Water Cost per year (USD)	16,490	14,320	12,000
Total Estimated Energy Usage per year (kWh)	92,780	87,490	58,310
Total Estimated Energy Cost per year (USD)	5,910	5,570	3,720
<b>Total Estimated Utility Operating Cost</b>	<b>\$22,400</b>	<b>\$19,890</b>	<b>\$15,716</b>

\*Water and energy use and costs are estimates only and are provided for the purpose of comparing the performance of evaporative condensers. Actual water/energy usage and costs will vary depending on weather, load profile, cycles of concentration and the control logic used to optimize system performance. Also, power, water and sewer costs are subject to local rates. The water and energy usage is calculated assuming a fixed condensing temperature and the use of variable frequency drives. Projected energy use is for evaporative condensers only, NOT total refrigeration system energy use. The Temperature Profile generated to estimate water and energy usage is based on 5 Year weather data from the National Climatic Data Center (NCDC). Load profiles utilized in the program are based on industrial refrigeration applications and have been provided courtesy of Cascade Energy - Portland, OR.

# eco-ATC-H Design Features

## eco-ATC-H Dry Performance Powered by Innovative Coil Technology

### Principle of Operation

#### Evaporative (Wet) Mode – Spray Pump(s) Energized

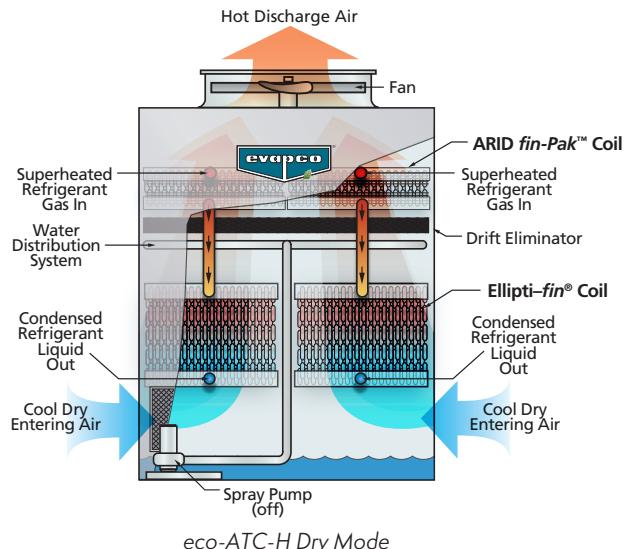

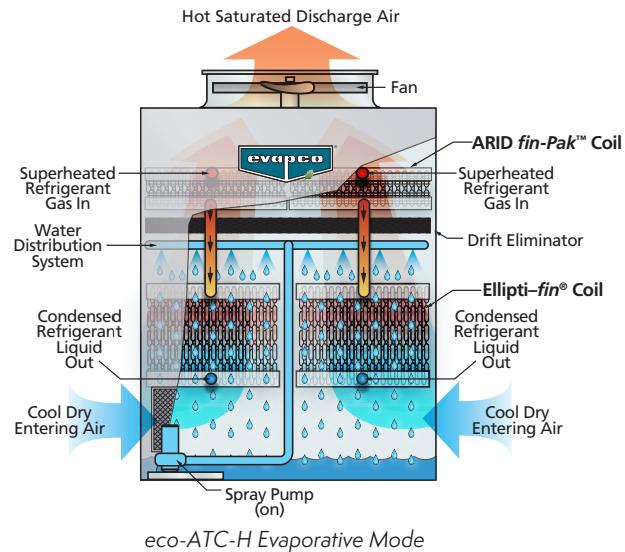

The refrigerant gas is discharged from the compressor into the inlet of the **ARID fin Pak™ Dry Coil** which is positioned in the discharge air stream above the unit's drift eliminators and below the fan section. Ambient air is drawn into the unit, by the condenser's fans, through inlet louvers located in the lower section above the water basin. The air is drawn upward through the wet coil into the drift eliminators (which remove entrained water droplets from the air stream) and into the **ARID fin Pak™ Dry Coil**. Heat from the refrigerant gas is transferred to the air as it comes into contact with the tubes and densely packed fins of the **ARID fin Pak™ Dry Coil**. The refrigerant gas exits the **ARID fin Pak™ Dry Coil** and travels via inter-connecting piping (by others) to the inlet of the **Ellipti-fin® Coil** located in the lower section of the eco-ATC-H Condenser. Water from the condenser's sump is circulated over the wet coil as the ambient air is simultaneously drawn into the unit and travels up through the **Ellipti-fin®**. A portion of the spray water is evaporated into the air stream as it travels through the wet coil. This evaporative process cools the spray water, which in turn cools the coil tubes and extended surface fins. The cool tube walls and extended surface fins cause the refrigerant gas to give up heat and condense into a liquid. The condensed liquid flows out of the **Ellipti-fin®** to the high pressure receiver for return to the system. The water which has not evaporated falls into the sump and is recirculated by the spray pump to the water distribution system located above the **Ellipti-fin®**.

**The amount of water consumed during this mode of operation is a function of the amount of heat rejected. Water consumption includes the volume of water which is evaporated during the cooling process and the amount of water which is discharged (referred to as "blow-down") to maintain the required cycles of concentration in order to meet water quality guidelines.**

#### Dry Mode – Spray Pump De-energized

The refrigerant gas is discharged from the compressor into the inlet of the **ARID fin Pak™ Dry Coil** which is positioned in the dry air stream above the unit's drift eliminators and below the fan section. Ambient air is drawn into the unit by the condenser's fans, through inlet louvers located in the lower section above the water basin. The air is drawn upward through the **Ellipti-fin®** into the **ARID fin Pak™ Dry Coil** above. Heat from the refrigerant gas is transferred to the air as it comes into contact with the tubes and densely packed fins of the **ARID fin Pak™ Dry Coil**. The refrigerant gas exits the **ARID fin Pak™ Dry Coil** and travels via the inter-connecting piping to the inlet of the **Ellipti-fin®**. The ambient air entering the unit travels upward through the **Ellipti-fin®** which in turn cools the coil tubes and extended surface fins. The cool tube walls and extended surface fins cause the refrigerant gas to give up heat and condense into a liquid. The condensed liquid flows out of the **Ellipti-fin®** to the high pressure receiver for return to the system.

There is **NO WATER** consumed during this mode of operation.

# eco-ATC-H Design Features

## Construction Features

EVAPCO, long known for using premium materials of construction, has developed the ultimate system for corrosion protection in galvanized steel construction – the EVAPCOAT Corrosion Protection System. Marrying corrosion free materials with heavy gauge mill hot-dip galvanized steel construction to provide the longest life product with the best value.

### G-235 Mill Hot-Dip Galvanized Steel Construction

Mill hot-dip galvanized steel has been successfully used for over 40 years for the protection of evaporative condensers against corrosion. There are various grades of mill galvanized steel each with differing amounts of zinc protection. EVAPCO has been a leader in the industry in developing heavier galvanizing, and was the first to standardize on G-235 mill hot-dip galvanized steel.

G-235 designation means there is a minimum of 2.35 ounces of zinc per square foot of surface area as measured in a triple spot test. G-235 is the heaviest level of galvanizing available for manufacturing evaporative condensers and has a minimum of 12% more zinc protection than competitive designs using G-210 steel.

During fabrication, all panel edges are coated with a 95% pure zinc-rich compound for extended corrosion resistance.

### Type 304 Stainless Steel Strainers

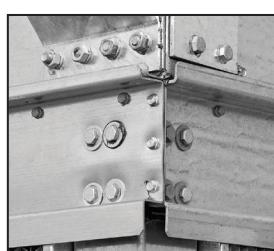

Subjected to excessive wear and corrosion, the sump strainer is critical to the successful operation of the condenser. EVAPCO uses only stainless steel for this very important component.

### Unique Seam Design—Eliminate Field Leaks

The eco-ATC-H features EVAPCO's unique panel construction design which includes a special butyl tape sealer. Each joint is then backed with a secondary caulking compound and encased in a double-brake flange for added strength and structural integrity. This unique sealing system has been proven effective in both laboratory tests and years of field application.

### Easy Field Assembly

The eco-ATC-H features a unique field seam design which ensures easier assembly and fewer field seam leaks. The field seam incorporates self-guiding channels to guide the coil casing section into position and set in place on the bottom basin section of the condenser. In addition, the design eliminates up to 66% of the fasteners typically used to join the condenser sections in the field significantly reducing the contractor labor costs for installation.

## Improved Maintenance

### ZM®II Spray Nozzle Water Distribution System

Even and constant water distribution is paramount for reliable, scale-free evaporative condensing. EVAPCO'S Zero Maintenance ZM® II Spray Nozzle remains clog-free under the toughest conditions to deliver approximately 6 GPM to every square foot of coil plan area.

The heavy-duty ABS ZM® II Spray Nozzles have a 1-1/4" diameter opening and a 1-1/4" splash plate clearance. The fixed position ZM® II Spray Nozzles are mounted in corrosion-free PVC water distribution pipes that have threaded end caps. Together, these elements combine to provide enhanced water droplet formation, delivered uniformly over the coil resulting in superior thermal performance and a virtually maintenance free water distribution system.

ZM®II Nozzle

### Alternate Materials of Construction

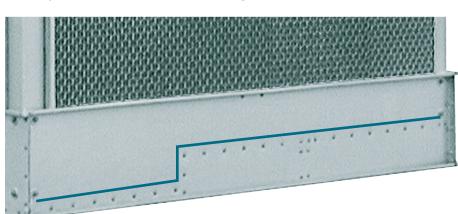

EVAPCO induced draft condensers have a modular design which allows for specific areas to be enhanced for increased corrosion protection. For particularly corrosive environments, EVAPCO condensers are available with Stainless Steel construction for the basin, casing and/or coil.

### Stainless Steel Basin

In addition to the EVAPCOAT Corrosion Protection System, EVAPCO offers optional Type 304 or Type 316 stainless steel construction for superior corrosion resistance. EVAPCO induced draft condensers have a modular design which allows for specific areas to be enhanced for increased corrosion protection. The basin area of a condenser is often subjected to high concentrations of impurities and silt. EVAPCO's stainless steel basin option includes welded seam construction as standard. For particularly corrosive environments, stainless steel construction is also available for the coil casing / fan section.

### "Clean Pan" Basin Design

EVAPCO eco-ATC-H condensers feature a sloped basin from the upper to lower pan section. This "Clean Pan" design allows the water to be completely drained from the basin. The condenser water will drain from the upper section to the depressed lower pan section where the dirt and debris can be easily flushed out through the drain. This design helps prevent buildup of sedimentary deposits, biological films and minimizes standing water.

# eco-ATC-H Design Features

## Belt Drive Units—8-1/2' & 17' Wide Models

The fan motor and drive assembly are designed to allow easy servicing of the motor and **adjustment of the belt tension from the exterior of the unit**. A TEFC fan motor is mounted on the outside of these models. A protective cover swings away to allow servicing and belt adjustment. A large hinged access door with a "quick release" latch provides access to the fan section for maintenance.

External Motor Mount  
(with optional ladder)

## Belt Drive Units—10', 12' & 24' Wide Models

The fan motor and drive assembly are designed to allow easy **servicing of the motor and adjustment of the belt tension from the exterior of the unit**.

The TEAO fan motor is located inside the fan casing on a rugged heavy duty motor base. The innovative motor base also features a unique locking mechanism for a positive adjustment.

The motor base is designed to swing out through a very large, 14 square foot access opening.

This allows for easy servicing of the motor.

Motor Base Assembly

## Drive System

**Inverter Duty Motors:** Inverter Duty Motors are standard on eco-ATC-H condensers. Inverter Duty motors are totally enclosed premium efficiency and inverter capable (VFD by others).

**Note:** Variable Frequency Drive control may require other component modification such as motor shaft grounding brushes, AC load reactors, low pass filters and tuned trap filters to ensure proper motor performance and service life.

**Power- Band Drive Belt:** The Power-Band is a solid-back, multigroove belt system that has high lateral rigidity. The proven drive system is used on 8' wide and wider models. The belt is constructed of neoprene with polyester cords. The drive belt is designed for minimum 150% of the motor nameplate horsepower for long life and durability.

**Fan Shaft Bearings:** The fan shaft bearings in eco-ATC-H units are specially selected for long, trouble-free life. They are rated for an L-10 life of 75,000 to 135,000 hours and are the heaviest pillow block bearing available.

**Aluminum Alloy Sheaves:** Fan sheaves are constructed of corrosion free aluminum for long life, eliminating the corrosion that occurs on cast steel sheaves, thereby extending belt life.

**Five Year Drive Warranty:** All drive components on eco-ATC-H units are covered by EVAPCO's exclusive 5 year drive warranty - including fan motors and belts!

## Superior Water Saver Drift Eliminators

An extremely efficient drift eliminator system is standard on EVAPCO condensers. The patented system removes entrained water droplets from the air stream to limit the drift rate to less than 0.001% of the recirculating water rate. The drift eliminators are constructed of an inert polyvinyl chloride (PVC) plastic material which effectively eliminates corrosion of these vital components. They are assembled in sections to facilitate easy removal for inspection of the water distribution system.

Water Saver Drift Eliminator

## Superior WST Framed Air Inlet Louver Design

EVAPCO'S WST Framed Inlet Louvers keep water in and sunlight out of the basins of induced draft products. The unique non-planar design is made from light-weight PVC sections which easily fit together and have no loose hardware, enabling easy basin access. U.S. Patent 7,927,196

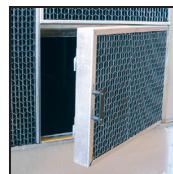

Framed Inlet Louver Design

Developed with computational fluid dynamics (CFD) software and tested in EVAPCO's R&D center, the louver's air channels are optimized to maintain fluid dynamic and thermodynamic efficiency and block all line-of-sight paths into the basin eliminating splash-out; even when the fans are off. Additionally, algae growth is minimized by blocking all sunlight.

The combination of rugged frames, easy basin access, no splash-out and minimized algae growth saves the end user money on maintenance hours, water consumption and water treatment costs.

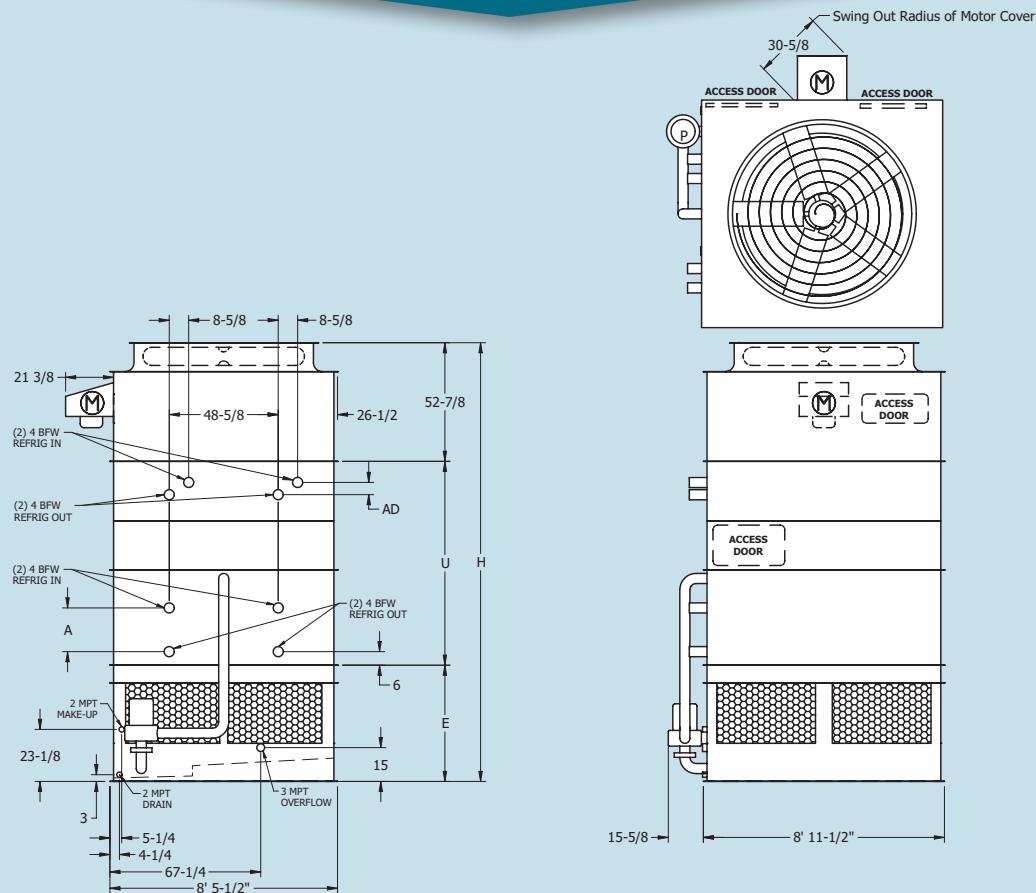

## Air Inlet Access Door (Optional)

To aid in basin maintenance, eco-ATC-H models can be equipped with an optional air inlet access door. This feature improves the maintainability of the condenser by allowing easy access to the make-up float assembly and strainer for inspection without removing an entire inlet louver.

\* Tons at standard conditions: 96.3°F condensing, 20°F suction and 78°F W.B.

\*\* Gallons shown is water in suspension in unit and piping. Allow for additional water in bottom of remote sump to cover pump suction and strainer during operation. (12" would normally be sufficient.)

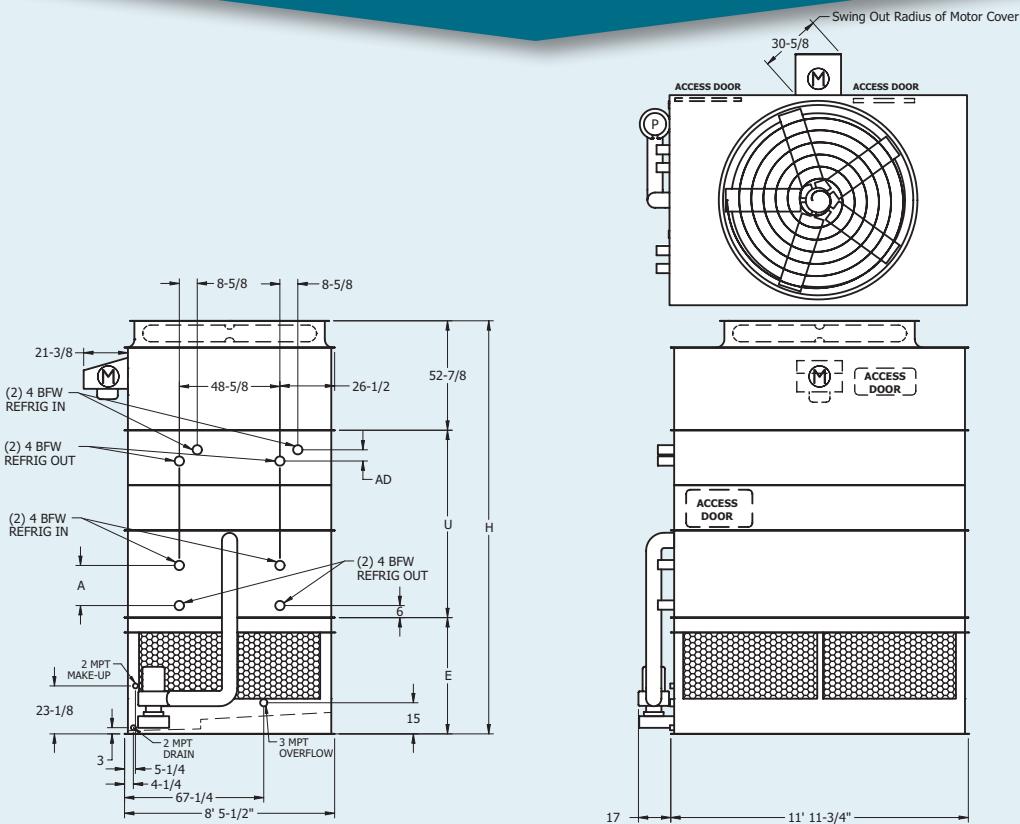

† Heaviest section is the coil section.

Dimensions are subject to change. Do not use for pre-fabrication. Quantity of coil connections subject to change based on refrigerant and design conditions.

NOTE: Interconnecting piping between ARID fin Pak™ Dry Coil outlets and Ellipti-fin® Coil inlets are field installed and tested (by others).

\* Tons at standard conditions: 96.3°F condensing, 20°F suction and 78°F W.B.

\*\* Gallons shown is water in suspension in unit and piping. Allow for additional water in bottom of remote sump to cover pump suction and strainer during operation. (12" would normally be sufficient.)

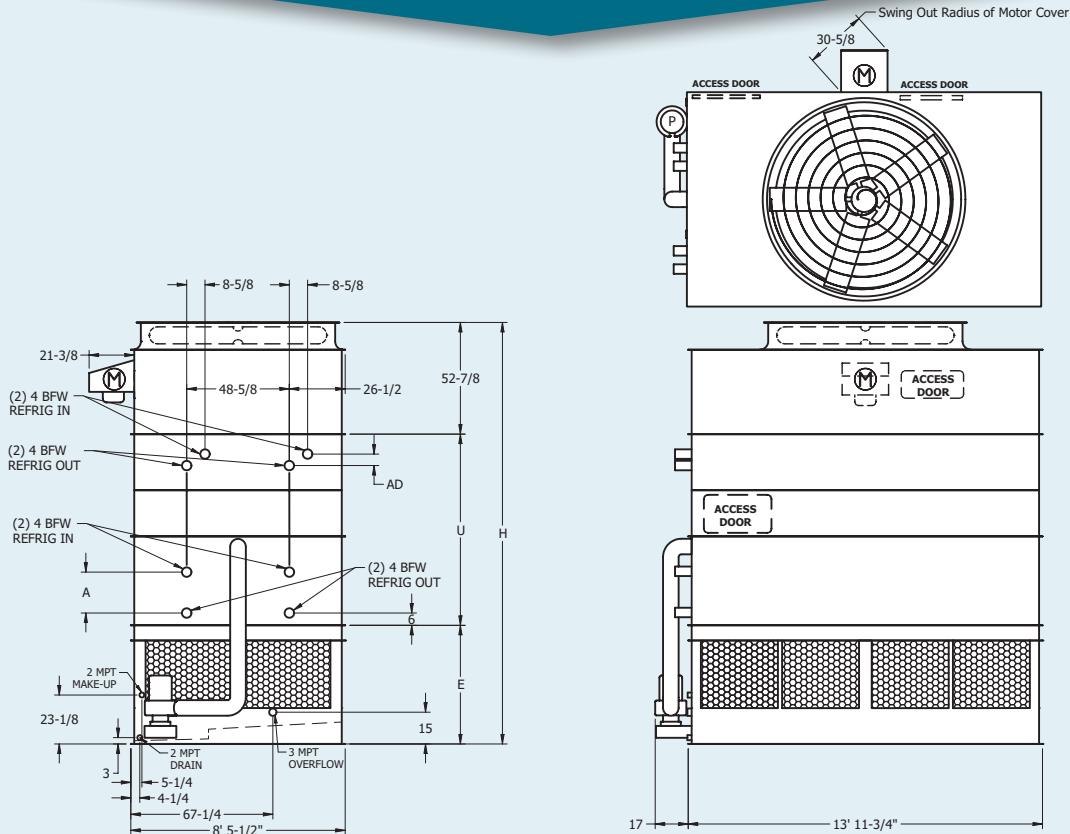

† Heaviest section is the coil section.

Dimensions are subject to change. Do not use for pre-fabrication. Quantity of coil connections subject to change based on refrigerant and design conditions.

NOTE: Interconnecting piping between ARID fin Pak™ Dry Coil outlets and Ellipti-fin® Coil inlets are field installed and tested (by others).

\* Tons at standard conditions: 96.3°F condensing, 20°F suction and 78°F W.B.  
\*\* Gallons shown is water in suspension in unit and piping. Allow for additional water in bottom of remote sump to cover pump suction and strainer during operation.  
(12" would normally be sufficient.)

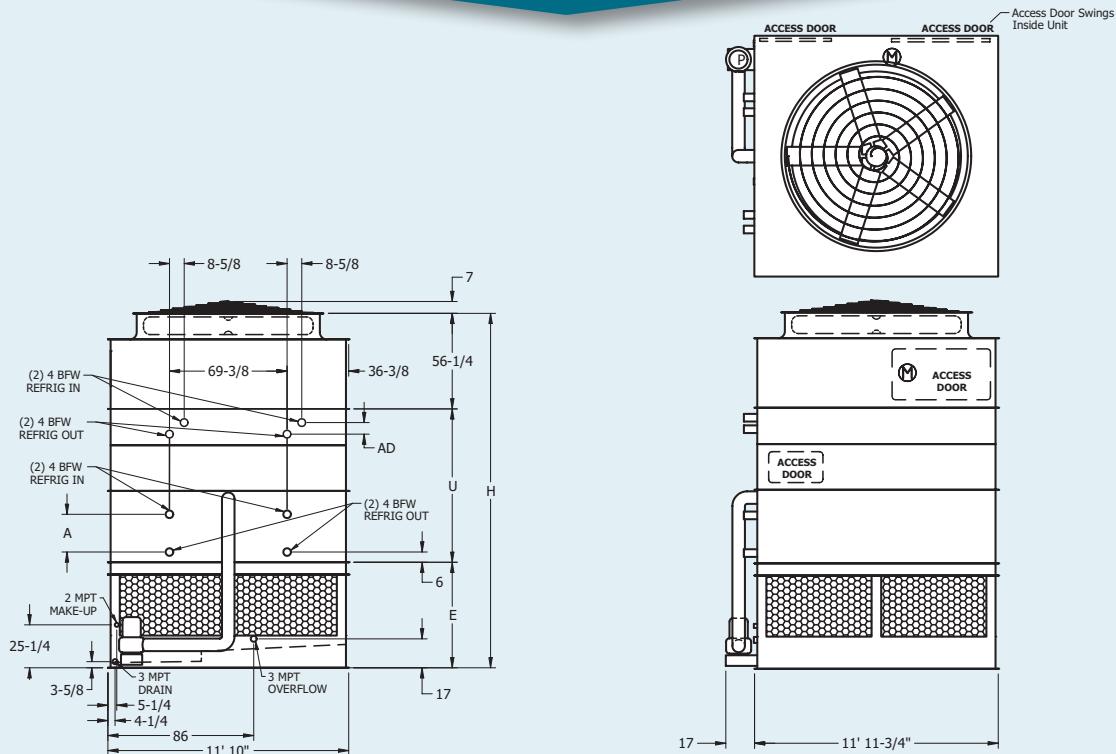

† Heaviest section is the coil section.

Dimensions are subject to change. Do not use for pre-fabrication. Quantity of coil connections subject to change based on refrigerant and design conditions.

NOTE: Interconnecting piping between ARID fin Pak™ Dry Coil outlets and Ellipti-fin® Coil inlets are field installed and tested (by others).

\* Tons at standard conditions: 96.3°F condensing, 20°F suction and 79°F W.B.

\*\* Gallons shown is water in suspension in unit and piping. Allow for additional water in bottom of remote sump to cover pump suction and strainer during operation. (12" would normally be sufficient.)

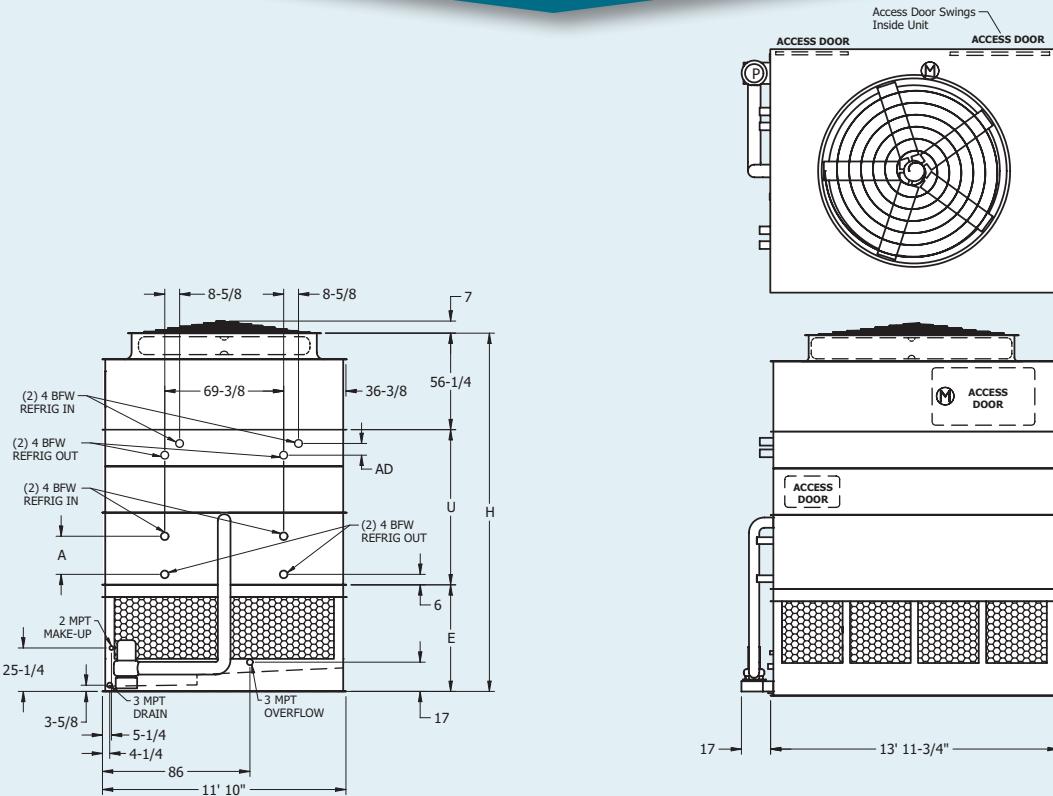

† Heaviest section is the coil section.

Dimensions are subject to change. Do not use for pre-fabrication. Quantity of coil connections subject to change based on refrigerant and design conditions.

NOTE: Interconnecting piping between ARID fin Pak™ Dry Coil outlets and Ellipti-fin® Coil inlets are field installed and tested [by others].

\* Tons at standard conditions: 96.3°F condensing, 20°F suction and 78°F W.B.

\*\* Gallons shown is water in suspension in unit and piping. Allow for additional water in bottom of remote sump to cover pump suction and strainer during operation. (12" would normally be sufficient.)

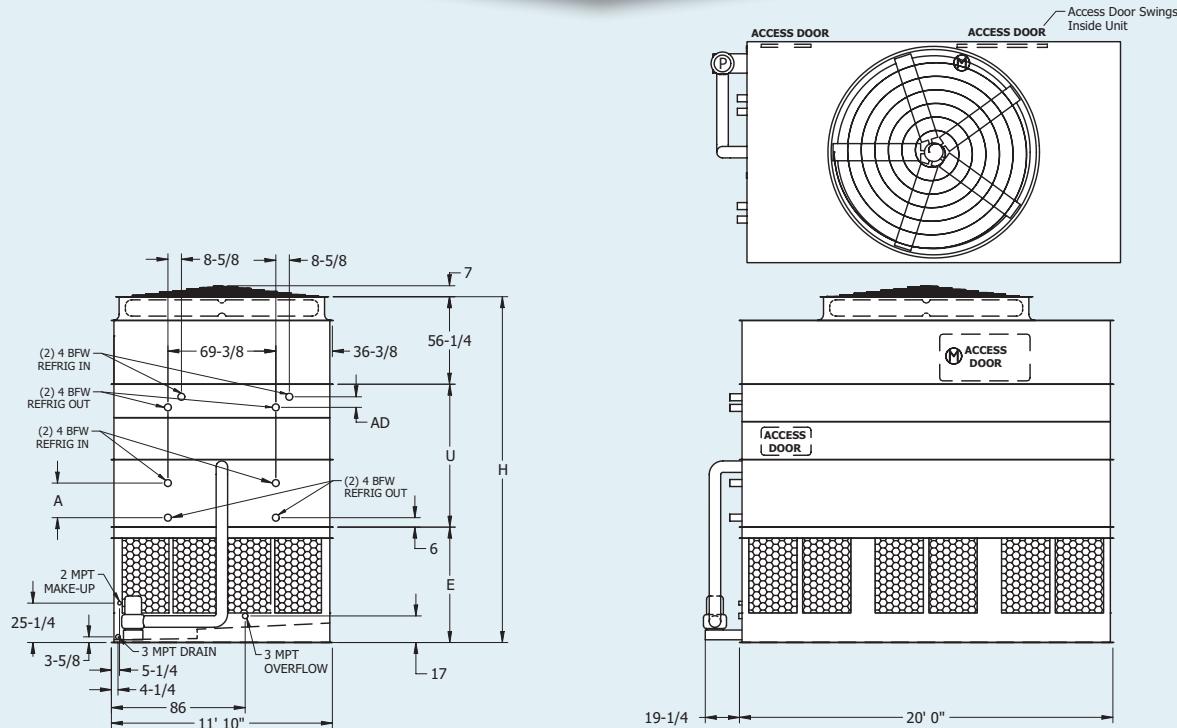

† Heaviest section is the coil section.

Dimensions are subject to change. Do not use for pre-fabrication. Quantity of coil connections subject to change based on refrigerant and design conditions.

NOTE: Interconnecting piping between ARID fin Pak™ Dry Coil outlets and Ellipti-fin® Coil inlets are field installed and tested (by others).

\* Tons at standard conditions: 96.3°F condensing, 20°F suction and 78°F W.B.

\*\* Gallons shown is water in suspension in unit and piping. Allow for additional water in bottom of remote sump to cover pump suction and strainer during operation. (12" would normally be sufficient.)

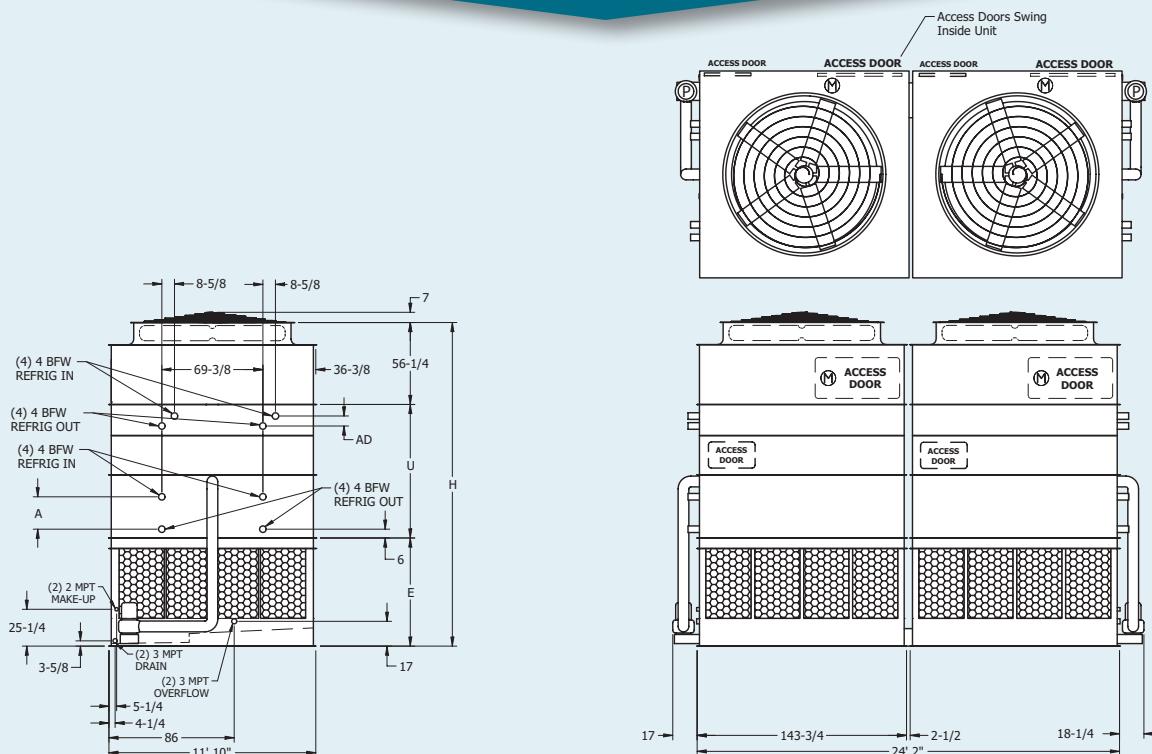

† Heaviest section is the coil section.

Dimensions are subject to change. Do not use for pre-fabrication. Quantity of coil connections subject to change based on refrigerant and design conditions.

NOTE: Interconnecting piping between ARID *fin Pak*™ Dry Coil outlets and Ellipti-*fin*® Coil inlets are field installed and tested (by others).

\* Tons at standard conditions: 96.3°F condensing, 20°F suction and 78°F W.B.

\*\* Gallons shown is water in suspension in unit and piping. Allow for additional water in bottom of remote sump to cover pump suction and strainer during operation. (12" would normally be sufficient.)

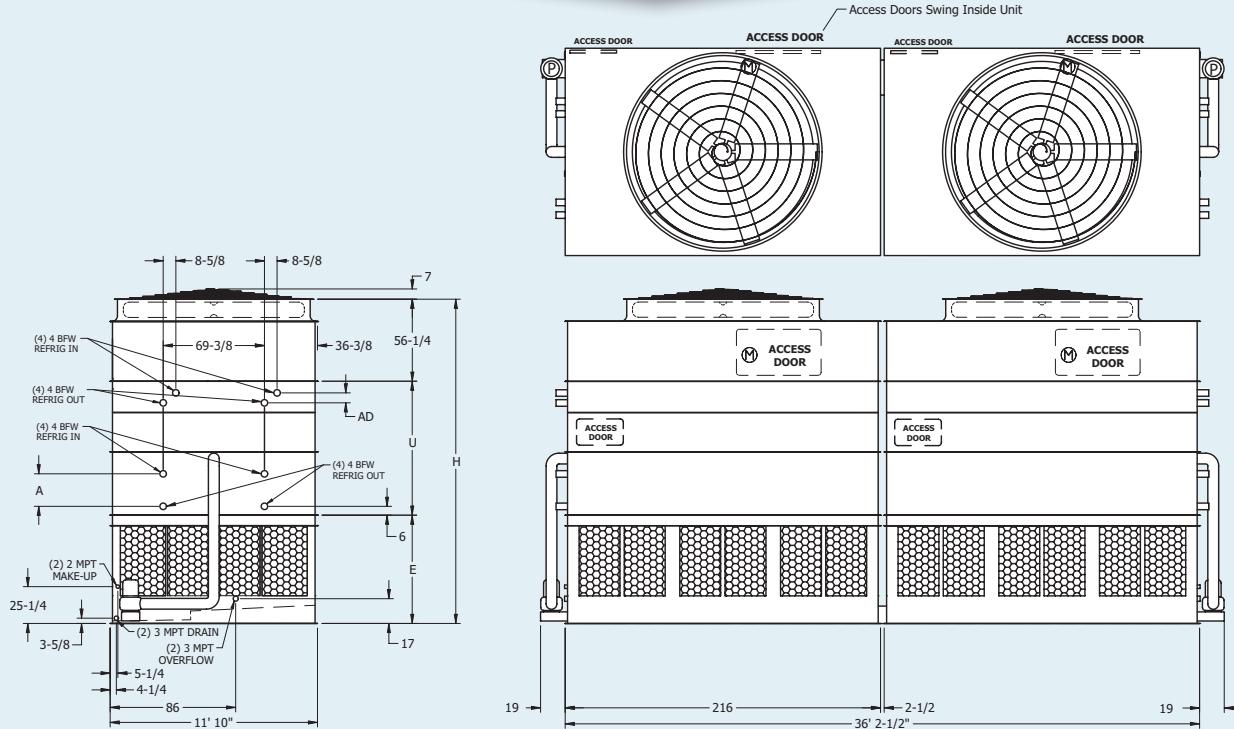

† Heaviest section is the coil section.

Dimensions are subject to change. Do not use for pre-fabrication. Quantity of coil connections subject to change based on refrigerant and design conditions.

NOTE: Interconnecting piping between ARID fin Pak™ Dry Coil outlets and Ellipti-fin® Coil inlets are field installed and tested (by others).

\* Tons at standard conditions: 96.3°F condensing, 20°F suction and 78°F W.B.

\*\* Gallons shown is water in suspension in unit and piping. Allow for additional water in bottom of remote sump to cover pump suction and strainer during operation. (12" would normally be sufficient.)

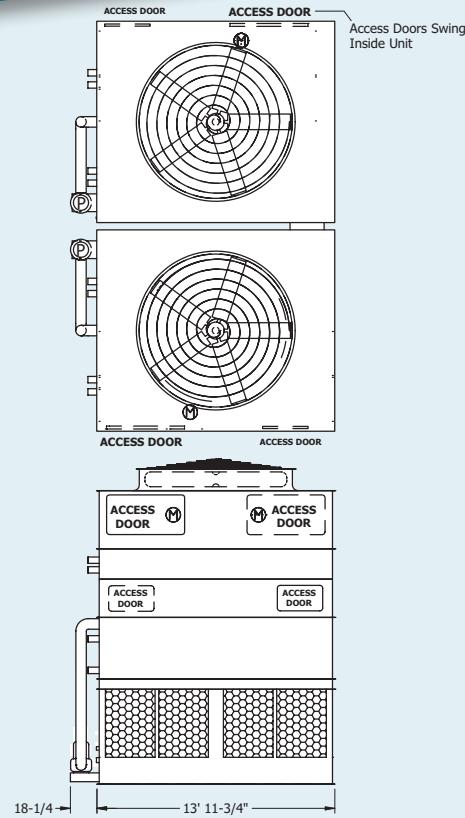

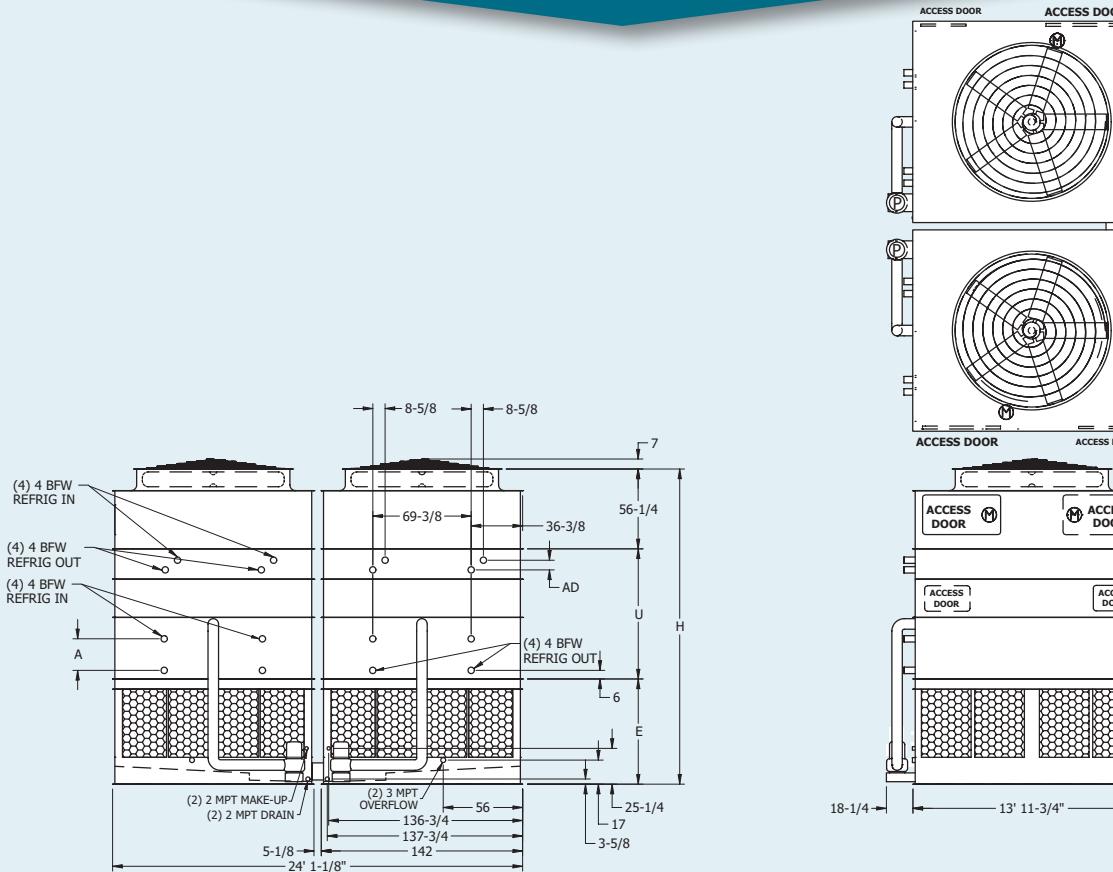

† Heaviest section is the coil section.

Dimensions are subject to change. Do not use for pre-fabrication. Quantity of coil connections subject to change based on refrigerant and design conditions.

NOTE: Interconnecting piping between ARID fin Pak™ Dry Coil outlets and Ellipti-fin® Coil inlets are field installed and tested (by others).

\* Tons at standard conditions: 96.3°F condensing, 20°F suction and 78°F W.B.

\*\* Gallons shown is water in suspension in unit and piping. Allow for additional water in bottom of remote sump to cover pump suction and strainer during operation. (12" would normally be sufficient.)

† Heaviest section is the coil section. Dimensions are subject to change. Do not use for pre-fabrication. Quantity of coil connections subject to change based on refrigerant and design conditions.

NOTE: Interconnecting piping between ARID fin Pak™ Dry Coil outlets and Ellipti-fin® Coil inlets are field installed and tested (by others).

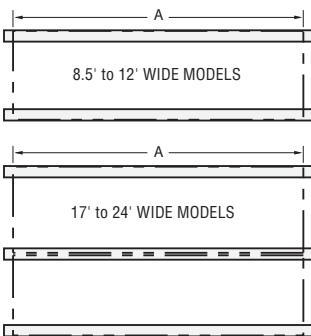

# eco-ATC-H Steel Support

EVAPCO eco-ATC-H condensers are designed to be supported with structural "I" beams located under the outer flanges and running the entire length of the unit. Mounting holes, 3/4" in diameter are located in the bottom channels of the pan section to provide for bolting to the structural steel. (Refer to certified drawings from the factory for bolt hole locations.)

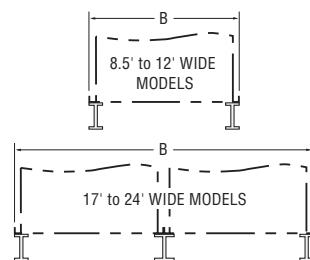

Beams should be level to within 1/8" in 6' before setting the unit in place. Do not level the unit by shimming between it and the "I" beams as this will not provide proper longitudinal support.

**NOTE: Consult IBC for required steel support layout and structural design.**

## Electric Heaters

Electric immersion heaters are available factory installed in the basin of the condenser. They are sized to maintain a +40° F pan water temperature with the fans off and an ambient air temperature of 0°F, -20°F or -40°F. They are furnished with a thermostat to cycle the heater on when required and a low water protection device to prevent the heater elements from energizing unless they are completely submerged. All components are in weather proof enclosures for outdoor use. The heater power contactors and electric wiring are not included as standard.

## Water Treatment Solutions

### Pulse~Pure® Non-Chemical Treatment

U.S. Patent No. 7,704,364

Pulse~Pure® is an environmentally sensitive non-chemical water treatment system for evaporative condensers. Developed by EVAPCO, Pulse~Pure offers an alternative to chemical water treatment programs. Utilizing pulse-power technology Pulse~Pure provides chemical-free treatment that is environmentally safe.

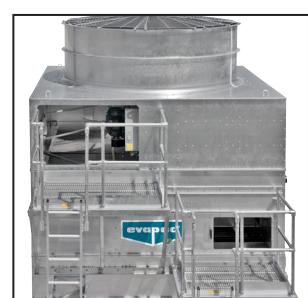

### Smart Shield® Solid Chemistry Water Treatment System

EVAPCO's SmartShield® solid chemistry water treatment system is an innovative solution to conventional liquid chemical programs. SmartShield® was developed specifically for evaporative condensers and closed circuit coolers. The system comes factory mounted and includes all the components required for an effective water treatment system. Solid products eliminate the potential for liquid spills making it easier and safer to use. Controlled release chemistry provides uniform treatment over a 30 day period.

### Self Supporting Service Platforms

Condensers are available with self-supporting service platforms that include access ladders which are designed for easy field installation. This option offers significant savings in comparison to field constructed, externally supported catwalks. The Evapco service platform option is located at each maintenance access door.

### Motor Davit

In the event that a fan motor should need to be replaced, a lightweight motor davit is available from which a chain fall can be mounted to easily lower the motor to the ground.

**ATC-DC Condenser with Optional Service Platforms**

# eco-ATC-H Optional Equipment

## Electric Water Level Control

Evaporative condensers may be ordered with an electric water level control in lieu of the standard mechanical float and make-up assembly. This package provides accurate control of water levels and does not require field adjustment.

## Sound Reduction Options

### Super-Low Sound Fan

EVAPCO's Super Low Sound Fan utilizes an extremely wide chord blade design and is ideal for low energy, sound sensitive installations without sacrificing thermal performance. This revolutionary technology is one-piece molded, heavy duty fiberglass reinforced polyester hub and blade construction utilizing a forward swept blade design. The Super Low Sound Fan is capable of reducing the unit sound pressure levels 9 dB(A) to 15 dB(A) depending on specific unit selection and measurement location.

### Water Silencer

The water silencer option, constructed of lightweight PVC sections, is located in the falling water area of the cold water basin. This option will reduce the overall sound levels 4 dB(A) to 7 dB(A), measured 5 ft. from the side or end of the unit, with no impact on unit thermal performance. This option will also reduce the overall sound levels 9 dB(A) to 12 dB(A) when operating the condenser with the fans off and water circulating.

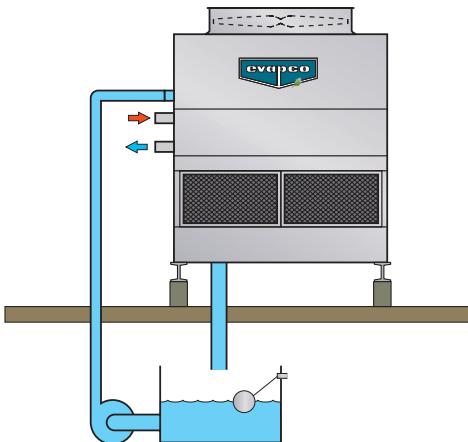

## Stainless Steel Basin

In addition to the EVAPCOAT Corrosion Protection System, EVAPCO offers optional Type 304 or Type 316 stainless steel construction for superior corrosion resistance. EVAPCO induced draft condensers have a modular design which allows for specific areas to be enhanced for increased corrosion protection. The basin area of a condenser is often subjected to high concentrations of impurities and silt. EVAPCO's stainless steel basin option includes welded seam construction as standard. For particularly corrosive environments, stainless steel construction is also available for the coil casing/fan section.

## Remote Sump Configuration

For units operating in areas where temperatures may be very low, or where low temperatures may occur during periods when the unit is not operating, a sump located inside the building is the preferred means of ensuring that the basin water will not freeze. For these applications, the condenser will be supplied without the spray pump, suction strainers and all associated piping, but with an oversize bottom outlet.

## Multiple Circuit Coils

Condensers may be supplied with multiple circuit coils to match various system requirements such as split systems, or if a glycol or water circuit is desired for compressor head cooling.

**Additional Options Available** – Please contact your local EVAPCO Sales Representative or the EVAPCO factory for assistance.

# eco-ATC-H Application

## Design

EVAPCO units are heavy-duty construction and designed for long trouble-free operation. Proper equipment selection, installation and maintenance is, however, necessary to ensure good unit performance. Some of the major considerations in the application of a condenser are presented below. For additional information, contact the factory.

## Structural Steel Support

The method of support for EVAPCO condensers is two structural "I" beams located under the outer flanges and running the entire length of the unit. Mounting holes 3/4" in diameter, are located in the bottom channels of the pan section to provide for bolting to the structural steel; refer to certified drawings from the factory for bolt hole locations.

Beams should be level to within 1/8" in 6' before setting the unit in place. Do not level the unit by shimming between it and the "I" beams as this will not provide proper longitudinal support.

**NOTE: Consult IBC for required steel support layout and structural design.**

## Air Circulation

In reviewing the system design and unit location, it is important that proper air circulation be provided. The best location is on an unobstructed roof top or on ground level away from walls and other barriers. Care must be taken when locating condensers in wells or enclosures or next to high walls. The potential for recirculation of hot, moist discharge air back into the fan intake exists. Recirculation raises the wet bulb temperature of the entering air causing the condensing pressure to rise above the design. For these cases, a discharge hood or ductwork should be provided to raise the overall unit height even with the adjacent wall, thereby reducing the chance of recirculation. Good engineering practice dictates that the evaporative condenser's discharge air not be directed or located close to or in the vicinity of building air intakes. Engineering assistance is available from the factory to identify potential recirculation problems and recommend solutions.

For additional information regarding layout of evaporative condensers, see EVAPCO Bulletin entitled "*Equipment Layout*".

## Piping

Condenser piping should be designed and installed in accordance with generally accepted engineering practice. All piping should be anchored by properly designed hangers and supports with allowance made for possible expansion and contraction. No external loads should be placed upon condenser connections, nor should any of the pipe supports be anchored to the unit framework. For additional information concerning refrigerant pipe sizing and layout, see EVAPCO Bulletin entitled "*Piping Evaporative Condensers*".

## Maintaining the Recirculated Water System

The heat rejection in a condenser is accomplished by the evaporation of a portion of the recirculated spray water. As this water evaporates, it leaves behind all of its mineral content and impurities. Therefore, it is important to bleed-off an amount of water equal to that which is evaporated to prevent the build-up of these impurities. If this is not done, the mineral or the acidic nature of the water will continue to increase. This will ultimately result in heavy scaling or a corrosive condition.

## Bleed-off

Each unit supplied with a pump mounted on the side is furnished with a clear bleed line for visual inspection and a valve which, when fully open, will bleed-off the proper amount of water. If the make-up water supplying the unit is relatively free of impurities, it may be possible to cut back the bleed, but the unit must be checked frequently to make sure scale is not forming. Make-up water pressure should be maintained between 20 and 50 psig.

## Water Treatment

A proper water treatment program is an essential part of routine maintenance in order to help assure proper operation and longevity of the unit. To help prevent the formation of "white rust", the interior of the unit should be passivated during start-up and monitored periodically as part of the water treatment program. For more information about white rust, please request a copy of EVAPCO Engineering Bulletin 36. A qualified water treatment company should be contacted to design a water treatment protocol specifically based on applicable location, water quality and unit materials of construction.

If acid is used for treatment, it should be accurately metered and the concentration properly controlled. **The pH of the water should be maintained between 6.5 and 8.0. Units constructed of galvanized steel operating with circulating water having a pH of 8.3 or higher will require periodic passivation of the galvanized steel to prevent the formation of "white rust".** Batch chemical feeding is not recommended because it does not afford the proper degree of control. If acid cleaning is required extreme caution must be exercised and only inhibited acids recommended for use with galvanized construction should be used.

**NOTE: Operating the condenser below 6.0 pH for any period of time may cause the removal of the protective zinc coating on the galvanized steel components.**

For more information see EVAPCO Bulletin entitled "*Maintenance Instructions*".

## Control of Biological Contamination

Water quality should be checked regularly for biological contamination. If biological contamination is detected, a more aggressive water treatment and mechanical cleaning program should be undertaken. The water treatment program should be performed in conjunction with a qualified water treatment company. It is important that all internal surfaces be kept clean of accumulated dirt and sludge. In addition, the drift eliminators should be maintained in good operating condition.

## Solutions for Sound Sensitive Applications

The eco-ATC-H product line is available with four (4) equipment options to reduce the overall sound generated from the side or top of the unit. Each option provides various levels of sound reduction and can be used in combination to provide the lowest sound level. Consult EVAPCO's *evapSelect®* selection program for unit sound levels. If a detailed analysis or full octave band data sheet is required for your application, please consult your EVAPCO Sales Representative.

**NOTE: These low sound options may impact the overall installed dimensions and weight of the unit.**

# eco-ATC-H Mechanical Specifications

Furnish and install, as shown on the plans, an EVAPCO model \_\_\_\_\_ induced draft, counterflow evaporative condenser with a condensing capacity of \_\_\_\_\_ MBH total heat of rejection when operating with \_\_\_\_\_ refrigerant at \_\_\_\_\_ °F condensing temperature at a design \_\_\_\_\_ ambient dry bulb temperature of \_\_\_\_\_ °F.

## IBC Compliance

The condenser shall be designed and constructed to meet the International Building Code (IBC) specifications for installed components per ASCE. The manufacturer shall provide a certificate of compliance to demonstrate that the equipment/unit has been independently tested and certified in accordance with the IBC.

## Basin and Casing

The basin and casing shall be constructed of G-235 hot-dip galvanized steel for long life and durability. Standard basin accessories shall include overflow, drain, type 304 stainless steel strainers, and brass make-up valve with plastic float.

## Models eco-ATC-H 9-2H9-U22 to eco-ATC-H 17-4M14-U34

### Fan Motor

\_\_\_\_\_ horsepower totally enclosed fan cooled motors with 1.15 service factor shall be furnished suitable for outdoor service on \_\_\_\_\_ volts, \_\_\_\_\_ hertz, and \_\_\_\_\_ phase.

Motor(s) shall be mounted on an adjustable base which is accessible from the outside of the unit for service. A swing away protective cover shall shield the motor and sheave from the weather.

### Drive

The fan drive shall be multigroove, solid back V-belt type with taper lock bushings designed for 150% of the motor nameplate horsepower. The belt material shall be neoprene reinforced with polyester cord and specifically designed for evaporative condenser service. Fan sheave shall be aluminum alloy construction. The fans and the fan sheaves shall be mounted on the shaft with a specially coated bushing to provide maximum corrosion protection. Belt adjustment shall be accomplished from the exterior of the unit. Bearing lube lines shall be extended to the exterior of the unit for easy maintenance.

## Models eco-ATC-H 10-2I12-U22 to eco-ATC-H 24-4P20-U34

### Fan Motor

\_\_\_\_\_ horsepower totally enclosed air over ball bearing fan motor(s), with 1.15 service factor shall be furnished suitable for service on \_\_\_\_\_ volts, \_\_\_\_\_ hertz, and \_\_\_\_\_ phase. Motor(s) shall be mounted on an adjustable base which allows the motor to swing to the outside of the unit for servicing.

### Drive

The fan drive shall be a multigroove, solid back V-belt type with taper lock bushings designed for 150% of the motor nameplate horsepower. The belt material shall be neoprene reinforced with polyester cord and specifically designed for evaporative condenser service. Fan and motor sheaves shall be aluminum alloy construction. The fans and fan sheaves shall be mounted on the shaft with a specially coated bushing to provide maximum corrosion protection. Belt adjustment shall be accomplished from the exterior of the unit. Bearing lube lines shall be extended to the exterior of the unit for easy maintenance.

## Axial Propeller Fans

Fans shall be heavy duty axial propeller type statically balanced. The fans shall be constructed of aluminum alloy or fiberglass reinforced polypropylene blades, installed in a closely fitted cowl with venturi air inlet. Fan screens shall be galvanized steel mesh and frame, bolted to the fan cowl.

## Fan Shaft Bearings

Fan shaft bearings shall be heavy duty self-aligning ball type with grease fittings extended to the outside of the unit. Bearings shall be designed for a minimum L-10 life of 75,000 hours.

## Water Recirculation Pump

The pump(s) shall be a close-coupled, centrifugal type with mechanical seal, installed vertically at the factory to allow free drainage on shut down. \_\_\_\_\_ horsepower totally enclosed motor(s) shall be furnished suitable for outdoor service on \_\_\_\_\_ volts, \_\_\_\_\_ hertz, and \_\_\_\_\_ phase.

## Heat Transfer Coils

### Dry Coil

Arid-fin Pak dry cooling coils shall be constructed of 5/8" diameter Type 304L Stainless Steel round tubing with carbon steel connections. Fins shall be marine grade aluminum with a fin density of 10 fins per inch. Tubing shall be hydraulically expanded into the fin plate for consistent contact. Coil shall have design pressure of 300 psi and shall be in compliance with ANSI/ASME B31.5, Refrigeration Piping and Heat Transfer Components. The coil assembly shall be strength tested in accordance with ANSI/ASME B31.5 and subsequently leak tested using air under water.

### Wet Coil

Ellipti-fin condensing coil shall be elliptical tubes of prime surface steel, encased in steel framework with entire assembly hot-dip galvanized after fabrication. All coil rows shall feature extended surface fins designed with sloping tubes for liquid drainage. Coil shall have design pressure of 300 psi and shall be in compliance with ANSI/ASME B31.5, Refrigeration Piping and Heat Transfer Components. The coil assembly shall be strength tested in accordance with ANSI/ASME B31.5 and subsequently leak tested using air under water.

## Water Distribution System

The system shall provide a water flow rate of 6 GPM over each square foot of unit face area to ensure proper flooding of the coil. The spray header shall be constructed of schedule 40 polyvinyl chloride pipe for corrosion resistance. All spray branches shall be removable for cleaning. Heavy-duty ABS spray nozzles with large 1-1/4" diameter opening and internal sludge ring to eliminate clogging. Nozzles shall be threaded into spray header to provide easy removal for maintenance.

## Eliminators

The eliminators shall be constructed entirely of inert polyvinyl chloride (PVC) in easily handled sections. The eliminator design shall incorporate three changes in air direction to assure complete removal of all entrained moisture from the discharge air stream. Maximum drift rate shall be less than 0.001% of the circulating water rate.

## Louvers

The louvers shall be constructed from polyvinyl chloride (PVC) and mounted in a rugged steel frame. The louvers shall be mounted in easily removable sections for access to the pan for maintenance. The louvers shall have a minimum of two changes in air direction to prevent splashout and block direct sunlight.

## Finish

All basin and casing materials shall be constructed of G-235 heavy gauge mill hot-dip galvanized steel. During fabrication, all panel edges shall be coated with a 95% pure zinc-rich compound for superior protection against corrosion.

## Notes

## OUR PRODUCTS ARE MANUFACTURED WORLDWIDE.
